BASB111; infection; otitis media; pneumonia; diagnosis; therapy; antibacterial; antimicrobial; vaccine.

The present sequence is that of BASB111 protein from Moraxella catarrhalis strain MC2931 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adults. The invention provides BASB111 polypeptides, and polynucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB111 polypeptides using recombinant methods. Also claimed is a vaccine composition comprising a BASB111 polypeptide, an immunogenic fragment of a BASB111 polypeptide, or a polypeptide, an immunogenic fragment of a BASB111 polypeptide. A BASB111, or comprising a Moraxella infection involves identifying a BASB111 polypeptide or antibody. A claimed method of diagnosing a Moraxella infection involves identifying a BASB111 polypeptide or antibody. A claimed therapeutic composition useful in treating humans with M. catarrhalis infection comprises at least 1

                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of proteins from Moraxella catarrhalis. These can be used to produce vaccines which protect against M. catarrhalis infection, which can otitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention

ce encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated concleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the cantisense expression; (4) an isolated containing the vector; (3) an isolated containing the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of identifying a compound that influences the activity of identifying a gene required for cellular proliferation or the biological pathway (6) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiott; (10) profiling a compound is activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, continuity part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 276
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2003-029926/02.

The present sequence is the protein sequence for the BASB202 protein of CC contypeable Haemophilus influenzee (NTHAL) strain 3224A (ATCC PT-1816) CC isolated from an octitis media patient in the USA, NTHi strain 3219C CC isolated from an octitis media patient in the USA, NTHi strain 3219C CC isolated from an octitis media patient in the Netherlands, and NTHi strain R10356 CC isolated from a meningitis patient in the Netherlands, and NTHi strain R10356 CC The invention provides BASB202 polypeptides and polynucleotides, vectors, CC Chast cells, and methods for producing the polypeptides by recombinant CC methods. Claimed vaccine compositions comprise a BASB202 polypeptide or CC polynucleotide. A claimed method of diagnosing NTHi infection involves cidentifying a BASB202 polypeptide or an antibody that is immunospecific for the polypeptide. A claimed therapeutic composition useful for CC treating humans with NTHI diseases comprises an antibody directed against CC a BASB202 polypeptide. NTHI diseases include otitis media, pneumonia, cCC with hearing loss, fluid accumulation in the middle ear, auditory nerve CC damage, delayed speech learning, invasive disease, chronic otitis media council tract, and inflammation of the middle ear. B-cell epitopes and T-helper CC cell epitopes from BASB202 may also be useful in vaccine compositions WPI, 2002-383180/41. N-PSDB; ABL56953, ABL56954, ABL56956. 밁 Ş Ş 뭐 δ 밁 Ş The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the essential genes cCC themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain cc antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent cdid not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences Matches Query Match Best Local (21-MAR-2000; 23-MAY-2000; 26-MAY-2000; 26-MAY-2000; 23-OCT-2000; 27-NOV-2000; 22-DEC-2000; Sequence 273 AA; Antisense; prokaryotic cellular proliferation protein; antibiotic; antibacterial; drug design. Protein encoded by

essential gene #15843

```
The present sequence is the protein sequence for the BASB202 protein of contypeable Haemophilus influenzae (NTH1) strain 27W16791W1 isolated from a cystic fibrosis patient in Denmark. Variability analysis of CR BASB202 protein among different NTH1 strains revealed 99-100% sequence cidentity. The invention provides BASB202 polypeptides and polypucleotides, vectors, host cells, and methods for producing the CP polypeptides by recombinant methods. Claimed vaccine compositions comprise a BASB202 polypeptide or polypucleotide. A claimed method of CC diagnosing NTH1 infection involves identifying a BASB202 polypeptide or an antibody that is immunospecific for the polypeptide. A claimed the comprises an antibody directed against a BASB202 polypeptide. NTH1 disease comprises an antibody directed against a BASB202 polypeptide. NTH1 CC diseases include otitis media, pneumonia, sinusitis, nosocomial confections, invasive disease, chronic otitis media with hearing loss, fluid accumulation in the middle ear, auditory nerve damage, delayed confilammation of the middle ear. B-cell epitopes and T-helper cell control polypeptide are shoper respiratory tract, and control polypeptide are shoper form BASB202 may also be useful in vaccine compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated BASB202 polypeptide of nontypeable Haemophilus influenzae useful for diagnosing a disease and in generating an immune response in

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

SEQ ID NO 58240; 1766pp; English

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression CC (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense CC nucleic acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide or its fragment whose expression is inhibited by the antisense CC polypeptide; (5) producing the polypeptide; (6) inhibited by the CC antisense nucleic acid; (4) an antibody capable of specifically binding CC the polypeptide; (5) producing the polypeptide; (6) inhibited by the CC proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation required for required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which he test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene CC product is overexpressed of underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of creatins, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational compound that inhibits the cardidate of creating processed; (12) determining the extent of the propagation of activity of a cardidate molecules for rational compound that of the cardidate of the target prokaryottic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained continuously substantial directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC or a gene on which the test compound that inhibits proliferation of an CC organism acts; (9) manufacturing an antibictic; (10) profiling a CC compound's activity; (11) a culture comprising strains in which the gene CC product is overexpressed or underexpressed; (12) determining the extent CC to which each of the strains is present in a culture or collection of CC strains; or (13) identifying the target of a compound that inhibits the CC proliferation of an organism. The antisense nucleic acids are useful for CC identifying proteins or screening for homologous nucleic acids required CC for cellular proliferation to isolate candidate molecules for rational CC drug discovery programs, or for screening homologous nucleic acids required CC required for proliferation in cells other than S. aureus, S. typhimurium, CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained CC in electronic format directly from WIPO at CC ftp.wipo.int/pub/published_pct_sequences

convolution of the production of the thirtheon of an isolated contributed acid, (2) a host cell containing the vector; (3) an isolated contributed or its fragment whose expression is inhibited by the contributed or its fragment whose expression is inhibited by the contributed contributed or its fragment whose expression is inhibited by the contributed or its fragment whose expression is inhibiting cellular polypeptide; (5) producing the polypeptide; (6) inhibiting cellular contributed for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of identifying a gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) conganism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent convaints activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent convaints of its present in a culture or collection of convaints; or (13) identifying the target of a compound that inhibits the gene proliferation of an organism. The antisense mucleic acids are useful for cellular proliferation to isolate candidate molecules for rational converse of the properson sucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target provide in earuginosa. The present sequence data for this patent did not format directly from WIPO at the sequence of the target provide in the converse of the printed specification, but was obtained contribution.

The invention relates to antisense inhibitors of genes essential to component of their use in identifying the genes, contains their use in identifying the genes, contains the interference of themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, consecutive development. The antisense nucleic acids can also be used to identify contains used in proliferation, to express these proteins, and to obtain contains used in proliferation, to express these proteins, and to obtain contibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The containsense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent contains of the printed specification, but was obtained in celectronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
the 6213 antisense sequences given in the specification where expression (c) of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid cenoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated contisense nucleic acid; (4) an antibody capable of specifically binding contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the contisense nucleic acid; (4) an antibody capable of specifically binding contisense nucleic acid; (4) an antibody capable of specifically binding condiferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway crequired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies cor a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of containing the cathodic strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                                                                                                                                       proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug.discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated contined; (5) producing the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for compound that influences the activity of the gene product or that has an activity against a biological pathway of identifying a gene required for cellular proliferation; (8) cor a gene on which a proliferation, or that inhibits gellular proliferation of a gene in an operon required for craganism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits gene product lies cor a gene on which the test compound that inhibits gene product lies cor a gene on which the test compound that inhibits gene product lies cor a gene on which a proliferation required gene or its gene product lies corporated for culture comprising strains in which the gene corporated so verexpressed or underexpressed; (10) profiling a compound s activity; (11) a culture comprising strains in which the gene corporates or collection of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational corporated for proliferation in cells other than S. aureus, S. typhimurium, corporated for proliferation in cells other than S. aureus, S. typhimurium, corporated for part of the printed specification, but was obtained in electronic format directly from wipo at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
